

BATTERY CABLE & TERMINAL

CABLE

Battery & Welding Cable

What is the difference between battery cable & welding cable?

- Battery cable is the OEM standard. Our battery cable meets or exceeds the standards established by the Society of Automotive Engineers (SAE). Battery cable is insulated with PVC which is flame-retardant, resistant to fuel, oil, acid and salt.
- Welding cable is made with very fine copper wire and insulated with a synthetic rubber. It is more flexible than battery cable, especially in cold temperatures. Welding cable is easier to route in tight spaces.

Reasons you should use color coded battery cable

- Easy and fast identification of the cable gauge
- The color coding matches the cable to the connector and crimper
- The color stripe helps you measure the length of your cable (see illustration below)
- Made in U.S.A. 

Why you need both red & black cable

The generally accepted industry practice is to use black insulated cable for negative (ground) wires and red insulated cable for positive wires. By using both black and red cable your wiring system will be easier to install and trouble-shoot.

How to match cable & equipment

- When replacing cable, always install heavier cable, never lighter.
- In cold climates, use a heavier cable gauge to improve starting.

250 MCM

The size bullets above will help you determine the gauge (size) of an unmarked starter cable. Measure the bare conductor only, not the insulation. Actual diameters vary depending on specific stranding of the wire.

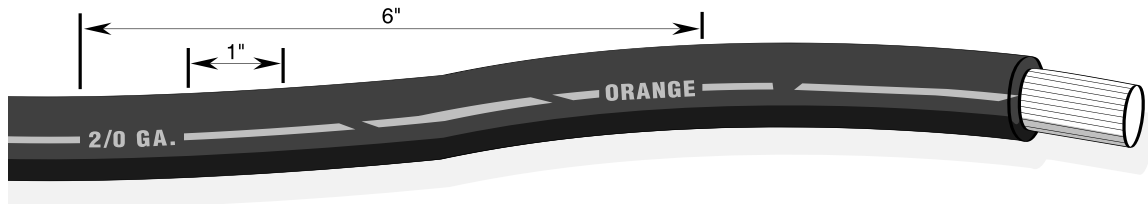

SPECIFICATIONS

GAUGE	COLOR CODED STRIPE	PRODUCT I.D.		PRODUCT I.D.
